Allowable Subject Matter

Claims 1 – 26 are allowed.

The prior art of record fail to teach a control system for a vehicle and method of determining an input command for a control system from a sensed input, the method comprising, among other limitations, comparing the absolute value of each of a first signal differential, a second signal differential and a third signal differential to a predetermined differential threshold *if* the absolute value of each of the first signal differential, the second signal differential and the third signal differential is less than or equal to the predetermined differential threshold, [*then*] using the processed sensor signal in each of the first controller, second controller and third controller for control based on the sensed input; *if* the absolute value of one of the first signal differential, second signal differential and third signal differential is greater than the predetermined differential threshold, [*then*] determining a resolved sensor signal for use in each of the first controller, second controller and third controller for control based on the sensed input – the first signal differential, the second signal differential, and the third signal differential are obtained from first unprocessed sensor signal, second unprocessed signal, and third unprocessed sensor signal, respectively; providing a fault indication for the respective unprocessed sensor signal associated with the related signal differential; and comparing the fault indication of the unprocessed sensor signal with the status indication of the sensor status signal of that unprocessed sensor signal; if the fault indication of the unprocessed sensor signal and the status indication of the sensor

status signal of that unprocessed sensor signal both indicate a fault, using the processed sensor signal in each of the first controller, second controller and third controller for control based on the sensed input if the fault indication of the unprocessed sensor signal with the status indication of the sensor status signal of that unprocessed sensor signal do not both indicate a fault, determining a resolved sensor signal for use in each of the first controller, second controller and third controller for control based on the sensed input.

Conclusion

Any inquiry concerning this communication or earlier communications from the examiner should be directed to /Yonel Beaulieu/ whose telephone number is (571) 272-6955. The examiner can normally be reached on Mon., Wed. & Thur. between 0900 and 1600.
